

## A new angle from SHY is just the prescription

An electric roof light screen shading system to cover an opening when required at a new NHS surgery in Edmonton; seemed straight forward enough.

However the suspended ceiling leading to the opening was at an angle of 6.4 degrees, so when the cloth is across the opening the ceiling and cloth make one continuous line. In addition the total length of the blind was over 16 metres. This required an innovative solution – the type SHY specialise in.

Two separate blinds were produced, each with a draw of over 8 metres winding onto two 160mm rollers and meeting perfectly in the middle. The SHY Zip channels ensured excellent alignment of the two blinds and most importantly provided full unobtrusive support for the whole length.

SHY's customer Enviroscreen was delighted and won the contract in competition with several major contract blind manufacturers thanks to another great operation from SHY.
